|------------------------------------|-----------------------------------|
| REPORT REFERENCE<br>AER-2026-00188 | DATE OF THIS REPORT<br>6 May 2026 |
| TYPE OF REPORT<br>Spontaneous      | SERIOUS?<br>Yes                   |

## B. Patient details

|                                                            |                             |
|------------------------------------------------------------|-----------------------------|
| PATIENT INITIALS<br>M.D.                                   | AGE AT ONSET<br>71-year-old |
| SEX<br>Female                                              | WEIGHT<br>59 kg             |
| RELEVANT MEDICAL HISTORY<br>osteoarthritis, hypothyroidism |                             |

## C. Reporter details

|                                              |                                          |
|----------------------------------------------|------------------------------------------|
| REPORTER NAME<br>Dr Rupert Ashgrove          | QUALIFICATION<br>Consultant Hepatologist |
| ORGANISATION<br>Meadowvale District Hospital | COUNTRY<br>United Kingdom                |

## D. Suspect and concomitant products

|                                     |                                                      |
|-------------------------------------|------------------------------------------------------|
| PRODUCT NAME<br>Fenaquil            | DOSE AND FREQUENCY<br>500 mg up to three times daily |
| ROUTE OF ADMINISTRATION<br>ORAL     | BATCH / LOT NUMBER<br>FNQ-2210A                      |
| THERAPY START DATE<br>17 April 2026 | ROLE<br>Suspect                                      |

## E. Adverse reaction

|                                      |                                                         |
|--------------------------------------|---------------------------------------------------------|
| REACTION REPORTED<br>acute hepatitis | DATE OF ONSET<br>2 May 2026                             |
| OUTCOME<br>Not recovered             | SERIOUSNESS CRITERIA<br>HOSPITALISATION_OR_PROLONGATION |

## F. Case narrative

A 71-year-old female took Fenaquil 500 mg effervescent tablets for acute migraine over a two-week period. She presented on 2 May 2026 with jaundice and marked fatigue. Alanine aminotransferase was 640 U/L and total bilirubin 78 umol/L. She was admitted for five nights. Viral hepatitis serology was negative and there was no history of alcohol excess. Fenaquil was stopped on admission.

## G. Relevant laboratory results

| Test                       | Result | Units               | Reference range | Flag |
|----------------------------|--------|---------------------|-----------------|------|
| Alanine aminotransferase   | 640    | U/L                 | 10 – 40         | H    |
| Aspartate aminotransferase | 412    | U/L                 | 10 – 35         | H    |
| Total bilirubin            | 78     | umol/L              | 3 – 21          | H    |
| Alkaline phosphatase       | 196    | U/L                 | 30 – 130        | H    |
| Serum creatinine           | 94     | umol/L              | 60 – 110        |      |
| Neutrophil count           | 3.8    | x10 <sup>9</sup> /L | 2.0 – 7.5       |      |
| Haemoglobin                | 131    | g/L                 | 120 – 160       |      |
| C-reactive protein         | 42     | mg/L                | < 5             | H    |

SYNTHETIC TEST DOCUMENT — generated for the Smart Inbox prototype. No real patient, reporter, product or event is described.
