

ADVERSE EVENT REPORT (paper form)

Ref: PAPER-0091 Date: 14/03/2026

PATIENT

Initials: A.M. Age: 58-year-old Sex: Female

Weight: 68 kg

History: hypertension, type 2 diabetes

SUSPECT DRUG

Velmoradine 20 mg once daily

Route: oral Batch: VLM-4471B

Started: 3 March 2026

REACTION

maculopapular rash

Onset: 12 March 2026 Outcome: recovering

Serious: no

NARRATIVE

The patient began Velmoradine 20 mg once daily for essential hypertension on 3 March 2026. Nine days later she developed a widespread itchy maculopapular rash across the trunk and both forearms. The drug was withdrawn on 13 March and the rash began to settle within 48 hours. No corticosteroid was required. She had taken no other new medicine in the preceding month.
